Purdue University and Louisiana Tech University are partnering on a research project (WaterRF #4661) to develop a manual of practice (MOP), for the condition assessment of small diameter (12” and smaller) ductile iron pipes. This project aims to collect input from industry, utility and condition assessment practitioners, about identifying failures in small diameter ductile iron pipes, the technology capabilities and barriers to implementation of condition assessment technologies, and developing guidelines for condition assessment programs.

This survey is geared towards Condition Assessment Technology Providers and will take approximately 15 minutes for completion. The information collected is confidential and will be used only for research purposes. Findings of the study will be aggregated and shared with the Water Research Foundation.

Abbreviations:
CA Condition Assessment
DIP Ductile Iron Pipe
ID Internal Diameter
WDS Water Distribution System

Terms:
Small DIP - Ductile iron pipe with an ID of 12 inch (30 cm) or less
1. Which of the following non-destructive non-invasive CA techniques do you provide for the CA of small diameter DIP? (You may select multiple boxes)

<table>
<thead>
<tr>

Please return the completed survey to Dulcy M. Abraham via email (dulcy@purdue.edu) or via postal mail to: Professor Dulcy M. Abraham. Lyles School of Civil Engineering, Purdue University, 550 Stadium Mall Drive, West Lafayette, IN 47907
Purdue University and Louisiana Tech University are partnering on a research project (WaterRF #4661) to develop a manual of practice (MOP), for the condition assessment of small diameter (12” and smaller) ductile iron pipes. This project aims to collect input from industry, utility and condition assessment practitioners, about identifying failures in small diameter ductile iron pipes, the technology capabilities and barriers to implementation of condition assessment technologies, and developing guidelines for condition assessment programs.

This survey is geared towards **Ductile Iron Pipe Manufacturers** and will take approximately **15 minutes** for completion. The information collected is confidential and will be used only for research purposes. Findings of the study will be aggregated and shared with the Water Research Foundation.

**Abbreviations:**
- CA  Condition Assessment
- DIP  Ductile Iron Pipe
- ID  Internal Diameter
- WDS  Water Distribution System

**Terms:**
Small DIP - Ductile iron pipe with an ID of 12 inch (30 cm) or less
Table 1. Small DIP failure modes

<table>
<thead>
<tr>
<th>Failure Mode</th>
<th>Figure</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Corrosion Pitting (Internal)</td>
<td><img src="image" alt="Internal Corrosion Pitting" /></td>
<td>A localized form of corrosion, which manifests itself as pits on the pipe’s internal surface.</td>
</tr>
<tr>
<td>Corrosion Pitting (External)</td>
<td><img src="image" alt="External Corrosion Pitting" /></td>
<td>A localized form of corrosion, which manifests itself as pits on the pipe’s external surface.</td>
</tr>
<tr>
<td>Blowout</td>
<td><img src="image" alt="Blown out hole" /></td>
<td>Blowouts occur when corrosion or graphitisation has reduced the strength of the pipe wall in a local area, to a point where a pressure surge causes the wall to rupture.</td>
</tr>
<tr>
<td>Bell Splitting (Split pipe)</td>
<td><img src="image" alt="Bell Splitting" /></td>
<td>The crack terminates just below the bell of the pipe.</td>
</tr>
<tr>
<td>Circumferential Failure</td>
<td><img src="image" alt="Circumferential fracture" /></td>
<td>Cracks propagate around the circumference of the pipe.</td>
</tr>
<tr>
<td>Longitudinal Failure</td>
<td><img src="image" alt="Longitudinal fracture" /></td>
<td>The pipe wall fractures parallel to the axis of the pipe.</td>
</tr>
<tr>
<td>Graphitization</td>
<td>N/A</td>
<td>A process which removes some of the iron in the pipe, but leaves behind a matrix of graphite flakes that is held together in part by iron oxide.</td>
</tr>
<tr>
<td>Joint Failure</td>
<td>N/A</td>
<td>As distinct from bell splitting or bell shearing which indicate fracture of the bell/socket, joint failure means that the joint is no longer watertight, resulting in leakage. This can undermine the pipe bedding and may produce heave forces in expansive clay soils.</td>
</tr>
</tbody>
</table>

Questions related to failure modes, causes of failure, and condition assessment of small DIP

1. Please rank the following external causes of failure for small diameter DIP, based on their frequency of occurrence? (Enter 1 for the most frequent cause of failure, 2 for the
second most frequent cause of failure, and so on. **Enter N/A if you have not experienced a particular cause of failure in small DIP**

<table>
<thead>
<tr>
<th>Cause of failure (External)</th>
<th>Frequency (1 – most frequent, 2 – second most frequent, and so on. N/A for no experience)</th>
<th>Comments (Please indicate if this is the initial cause or the final trigger leading to failure)</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

9. Do you have any specific hauling/handling requirements/instructions for small diameter DIP? If Yes, please specify what they are?
   
   __________________________________________
   __________________________________________

10. Is there a standard installation procedure for the small DIP that you manufacture? If Yes, please specify what it is?

   __________________________________________
   __________________________________________

11. Please list the Quality Control/Quality Assurance procedures for the small DIP that you manufacture?

   __________________________________________
   __________________________________________

12. Do you have estimates of the service life of small DIP? If yes, please provide us with that data?

   __________________________________________
   __________________________________________

13. Do you recommend any techniques for extending the life of small DIP? If yes, please elaborate on those techniques?

   __________________________________________
   __________________________________________

14. Do you recommend the following methods for small DIP? Please answer yes/no.
   a. Installation of corrosion test stations (CTS): ________
   b. Collect/test pipe-to-soil potentials: ________
   c. Performing soil analysis: ________
   d. Stray current interference testing: ________
   e. Using cathodic protection: ________
   f. Installation of pipe joint bonds: ________
g. Installation of polyethylene encasement: __________
h. Relying on the asphaltic coatings: __________
i. Operating until failure: __________
